MISSION STATEMENT

“LILYCO SERVICES, LLC aims to be a catalyst for change in addressing the Opioid Epidemic. LILYCO will use approaches that are designed to be flexible, consumer-centered, culturally responsive and empirically-based. LILYCO will assist consumers in recognizing the “dream “of improving behavioral and mental health outcomes.”

SERVICES

The Clinical Assessment

The Clinical Assessment is a face-to-face evaluation of a client’s overall mental health which results in effectively matching the individual with the most appropriate level of care and service. It also provides the foundation for the development of the client’s Person Centered Plan. Additionally, the Clinical Assessment can assist in determining the level of readiness and motivation to engage in treatment.

Office-Based Opioid Treatment (OBOT)

Office-Based Opioid Treatment (OBOT) is a service designed to offer individuals an opportunity to maintain changes in their lifestyle by using opioid replacement therapy approved by the Food and Drug Administration (FDA) for the treatment of opioid addiction. At LILYCO SERVICES, LLC, OBOT consists primarily of the prescribing of buprenorphine (e.g., Suboxone) for the treatment or maintenance of individuals suffering from opioid addiction, as well as therapeutic services like outpatient therapy (individual or group), and treatment coordination to appropriate enhanced services.

Outpatient Therapy (OPT)

Outpatient Therapy is based on clinical need and available to adults for whom it is determined therapy may be an effective means to reduce symptoms or eliminate impairment. Individual and group therapy sessions are available and ongoing individual sessions are offered either at the LILYCO office or the individual’s home.

Psychiatric Medication Management

Medication Management is provided by LILYCO’s psychiatrist to determine whether a medication would be helpful for the adult and works with the individual over time to assess effectiveness of the medication. Proper medication can assist the individual in being better able to positively affect their mental health and fully utilize all aspects of their treatment. Common conditions treated with medication regimens are Anxiety, Depression, Bipolar disorder, and PTSD disorders.
